

ARE YOU FULLY DRESSED?

DON'T FORGET YOUR SAFETY EYEWEAR!

All employees will wear appropriate eye protection to prevent injury from job related hazards.

SAFETY GLASSES

Always ask yourself the question, "Are these glasses adequate protection for the task at hand?" If there is any question, seek help from your supervisor to secure adequate protection. Safety glasses are manufactured to ANSI Z87.1 Standards. These standards stipulate the impact resistance, construction and design of all safety eyewear. Approved prescription and standard safety glasses must be equipped with side shields. Clear lenses must always be worn inside the shop, unless you are a welder. If you do not have ANSI approved safety glasses, you are not properly dressed!

SAFETY GOGGLES

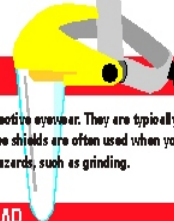

Goggles are also impact resistant and can be worn over safety glasses. Goggles are usually worn when the source of an eye injury could come from many directions (grinding, chipping, etc.). Goggles are required anytime you handle chemicals. This equipment is also vented for your own comfort.

FACE SHIELDS

Face shield and helmets are not in themselves protective eyewear. They are typically used in conjunction with safety glasses or goggles. Full face shields are often used when you are exposed to chemicals, heat or excessive physical hazards, such as grinding.

USING PROTECTIVE EYEWEAR

ORDER #GG167

You can guard against eye injury by making sure you are wearing the appropriate eye protection for your task at hand. It's important to remember that regular safety glasses alone do not always offer adequate protection, we expect you to ask your supervisor if you have any questions regarding appropriate eye protection for your job. Protect your eyes, there are beautiful things to see in this world.
